

**DESCRIPTION****ORNITHINE DERIVATIVES  
AS PROSTAGLANDIN E<sub>2</sub> AGONISTS OR ANTAGONISTS**

5

**TECHNICAL FIELD**

This invention relates to new ornithine derivatives and pharmaceutically acceptable salts thereof which are useful as prostaglandin E<sub>2</sub> (hereinafter described as PGE<sub>2</sub>) agonist or antagonist.

10

**BACKGROUND ART**

PGE<sub>2</sub> is known as one of the metabolites in an arachidonate cascade. It is also known that PGE<sub>2</sub> has various activities such as pain inducing activity, pro- or anti-inflammatory activity, uterine contractile activity, a promoting effect on digestive peristalsis, an awaking activity, a suppressive effect on gastric acid secretion, hypotensive activity, platelet inhibition activity, bone-resorbing activity, angiogenic activity, or the like.

15

20

PGE<sub>2</sub>-sensitive receptors have been sub-divided into four subtypes, EP1, EP2, EP3 and EP4, and these receptors have a wide distribution in various tissues. The effects associated with EP1 receptor activator are believed to be mediated by mobilization of Ca<sup>2+</sup> from intracellular stores. The EP3 receptor is an example of promiscuous receptor that may couple to different second-messenger systems. Further, the effects associated with EP2 and EP4 receptors activator may be considered as inhibitory, and are believed to be associated with a stimulation of adenylate cyclase and an increase in levels of intracellular cyclic AMP. Especially, EP4 receptor may be considered to be associated with smooth muscle relaxation,

anti-inflammatory or pro-inflammatory activities, lymphocyte differentiation, antiallergic activities, kidney dysfunction, mesangial cell relaxation or proliferation, gastric or enteric mucus secretion, or  
5 the like.

PGE<sub>2</sub> receptor blockers, in other words "PGE<sub>2</sub> antagonists", possess binding activities to PGE<sub>2</sub>-sensitive receptors. Accordingly, they possess a PGE<sub>2</sub>-antagonizing or PGE<sub>2</sub>-inhibiting activity.  
10 Therefore, they are expected as a medicament to treat and prevent PGE<sub>2</sub> mediated diseases. Similarly, PGE<sub>2</sub> agonists can be medicaments for PGE<sub>2</sub> mediated diseases. These PGE<sub>2</sub> agonists or antagonists are expected as a medicament to treat and prevent EP4 receptors-mediated  
15 diseases, such as kidney dysfunction, inflammatory conditions, various pains, or the like in human beings or animals.

Such PGE<sub>2</sub> antagonist is known. For example, in WO 00/16760 and WO 00/18744, oxazole compounds are  
20 disclosed.

#### DISCLOSURE OF INVENTION

Under the above situation, the inventors of the present invention found that the compounds having an  
25 ornithine skeleton or ornithine derivative skeleton bind preferentially to PGE<sub>2</sub> receptor, therefore they can be good PGE<sub>2</sub> agonists or antagonists, particularly EP4 receptor blockers. As the result, the inventors completed this invention.

30 Accordingly, the present invention relates to novel ornithine derivatives which are useful for treating or preventing PGE<sub>2</sub> mediated diseases. One object of this invention is to provide new compound and pharmaceutically acceptable salt thereof as  
35 prostaglandin E<sub>2</sub> agonists or antagonists.

Another object of this invention is to provide a medicament and pharmaceutical composition containing the compound as an active ingredient.

5 A further object of this invention is to provide an agonist or antagonist of PGE<sub>2</sub> consisting of the ornithine derivative and a method for treatment and/or prevention of PGE<sub>2</sub> mediated diseases which comprises administering an effective amount of the ornithine derivative.

10 A further object of the present invention is to provide a use of the ornithine derivative.

A further object of the present invention is to provide the compound and pharmaceutically acceptable salt thereof which are useful for the manufacture of  
15 medicaments for treating or preventing conditions mediated by PGE<sub>2</sub>, more particularly useful for treating or preventing kidney dysfunction, inflammatory conditions, various pains, collagen diseases, autoimmune diseases, various immunity diseases,  
20 analgesic, thrombosis, allergic disease, cancer and neurodegenerative diseases.

A further object of this invention is to provide the commercial package comprising the pharmaceutical composition containing the ornithine derivative.

## Process 1-1

The compound (Ia-1) or its salt can be prepared by the following steps:

10 derivative at the carboxy group, or the salt thereof,  
with the compound (IIIa) or its reactive derivative  
at the amino group, or the salt thereof to give the  
compound (IVa) or its salt; and  
[step b] reacting the obtained compound (IVa) or its  
15 salt, with the compound (V) or its reactive derivative  
at the carboxy group (in case of Q is -CO-)/the sulfo  
group (in case of Q is -SO<sub>2</sub>-), or the salt thereof.

[step a] in Process 1-1

20 In this process, the amine compound (IIIa) can  
be used on sale or can be synthesized according to  
general methods obvious to the person skilled in the  
organic chemistry from commercial compounds.

Suitable reactive derivative of the amine

reaction of the compound (IIIa) with a carbonyl  
compound such as aldehyde, ketone or the like; a silyl  
derivative formed by the reaction of the compound  
30 (IIIa) with a silylating reagent such as  
N,O-bis(trimethylsilyl)acetamide, N-trimethyl-  
silylacetamide, or the like.

Suitable reactive derivative of the carboxylic

expression of prostanoid receptor subtype

#### [I] Test Compound:

Sodium 6-((2S)-2-[(1-benzofuran-2-yl-carbonyl)-  
15 amino]-5-[benzyloxycarbonylamino]pentanoylamino)-  
hexanoate (Example 23)

#### [II] Test Method:

incubated for 1hour at 30°C. The reaction was  
terminated by that the mixture was rapidly filtered

washed with 4mL of ice-cooled buffer two times. The  
radioactivity associated with the filter was measured  
by liquid scintillation counting.

In the experiment for competition of specific  
30 [<sup>3</sup>H]-PGE<sub>2</sub> was added at a concentration of 10nM. The  
following buffer was used in all reactions.

Buffer: 20mM Mes (pH 6.0), 1mM EDTA, 10mM MgCl<sub>2</sub>

The inhibition (%) of the compound at a  
concentration of 10nM was shown below.
